NetCDF

Network Common Data Form

- Data model for scientific data and metadata
 - ▶ Widely used in ocean, climate, atmospheric science
 - ▶ Used in some other disciplines: molecular dynamics, neuro imaging, fusion research
- File format for portable data
 - ▶ Array-oriented scientific data and metadata
 - ▶ NetCDF data is self-describing, portable, direct access, appendable, networkable, extensible, sharable, archivable
- Application programming interfaces (APIs)
 - ▶ C, Java, C++, Fortran (Developed and supported by UCAR / Unidata)
 - ▶ Python, Ruby, Perl, MATLAB, R (3rd party APIs)

NetCDF classic data model

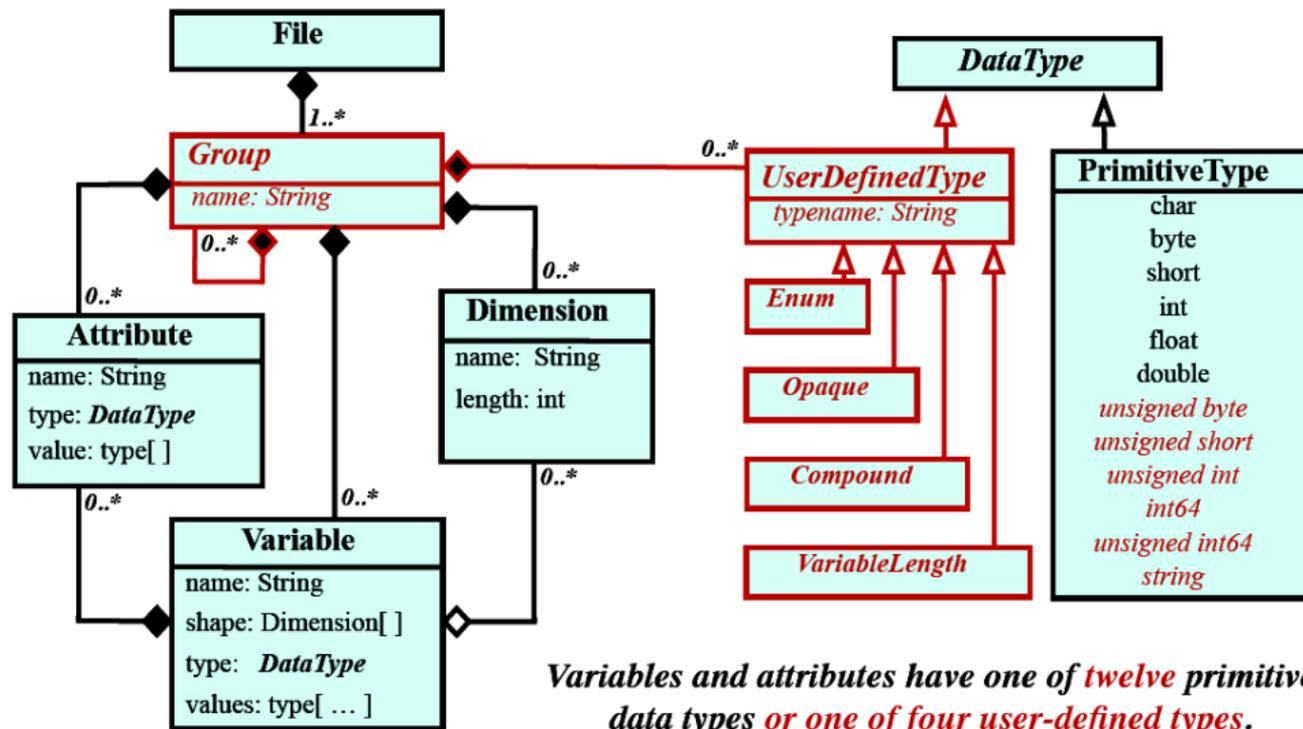

- NetCDF Data has :
 - ▶ Variables (eg temperature, pressure)
 - ▶ Attributes (eg units)
 - ▶ Dimensions (eg time)
- Each variable has
 - ▶ Name, shape, type, attributes
 - ▶ N-dimensional array of values
- Each attribute has
 - ▶ Name, type, value(s)
- Each dimension has
 - ▶ Name, length
- Variables may share dimensions
 - ▶ Represents shared coordinates, grids
- Variable and attribute values are of type
 - ▶ Numeric: 8-bit byte, 16-bit short, 32-bit int, 32-bit float, 64-bit double
 - ▶ Character: arrays of char for text

output of : ncdump Test.nc :

```
netcdf Test {
dimensions:
    Dimension = 4 ;
    NRecords = UNLIMITED ; // (10 currently)
variables:
    float momentum(NRecords, Dimension) ;
    momentum:units = "GeV" ;
data:
    momentum =
-24.68694, 22.93542, -48.75218, 59.2652,
9.410192, 43.30603, 8.885784, 45.1999,
-34.1302, -5.663451, 42.07206, 54.47121,
12.25947, 26.26641, -3.21174, 29.1658,
30.63048, -17.76378, 39.78646, 53.2621,
42.81401, -36.93607, -4.968459, 56.76362,
-32.08664, -33.3213, 44.05455, 63.88094,
-13.81777, 1.84193, -15.19944, 20.6266,
25.82092, -8.994961, -26.58193, 38.13579,
-25.00047, -16.52758, 6.168945, 30.59985 ;
}
```

NetCDF-4 format

NetCDF-4 format

- The opaque type is a type which is a collection of objects of a known size. Nothing is known to NetCDF about the contents of these blobs of data, except their size in bytes, and the name of the type.
- A variable length array is represented in C as a structure from HDF5, the `nc_vlen_t` structure. It contains a `len` member, which contains the length of that array, and a pointer to the array.
- A compound datatype is similar to a struct in C and contains a collection of one or more atomic or user-defined types.
 - ▶ It has a fixed total size.
 - ▶ It consists of zero or more named members that do not overlap with other members.
 - ▶ Each member has a name distinct from other members.
 - ▶ Each member has its own datatype.
 - ▶ Each member is referenced by an index number between zero and N-1, where N is the number of members in the compound datatype.
 - ▶ Each member has a fixed byte offset, which is the first byte (smallest byte address) of that member in the compound datatype.
 - ▶ In addition to other other user-defined data types or atomic datatypes, a member can be a small fixed-size array of any type with up to four fixed-size dimensions (not associated with named NetCDF dimensions).

NetCDF-4 format

- Uses HDF5 as a storage layer
- Provides performance advantages of HDF5
 - ▶ Compression
 - ▶ Chunking
 - ▶ Parallel I/O
 - ▶ Efficient schema changes
- Useful for larger or more complex datasets
- Suitable for high-performance computing

NetCDF-4 format : endianness

- NetCDF4 support little endian and big endian
- Default : NC_ENDIAN_NATIVE for native endianness
- can change the endianness of a variable with the function `nc_def_var_endian` :
`nc_def_var_endian(int ncid, int varid, int endian);`
 - ▶ `ncid` : NetCDF ID, from a previous call to `nc_open` or `nc_create`.
 - ▶ `varid` : Variable ID.
 - ▶ `endian` :
 - ★ NC_ENDIAN_NATIVE for native endianness.
 - ★ NC_ENDIAN_LITTLE for little endian
 - ★ NC_ENDIAN_BIG for big endian.

NetCDF compound variable

Will show an example to read and write a compound variable in :

- Python
- C++
- R

The compound variable will have 10 records with 8 members :

name	ADCcount	grid_I	grid_J	pressure	energy	idnumber	pressure2
16-character String	Unsigned short integer	32-bit integer	32-bit integer	float (single-precision)	double (double-precision)	Signed 64-bit integer	2-dim table of float (2*3)

Create compound with Python

```
from netCDF4 import Dataset
from netCDF4 import chartostring, stringtoarr
import numpy

f = Dataset('particles.nc', 'w', format='NETCDF4')

size = 10

Particle = numpy.dtype([( 'name', 'S1', 16),
                        ( 'ADCcount', numpy.uint16 ),
                        ( 'grid_i', numpy.int32 ),
                        ( 'grid_j', numpy.int32 ),
                        ( 'pressure', numpy.float32 ),
                        ( 'energy', numpy.float64 ),
                        ( 'idnumber', numpy.int64 ),
                        ( 'pressure2', numpy.float32, (2,3) )
                       ])

Particle_t = f.createCompoundType(Particle, 'Particle')

f.createDimension('NRecords', None)
v = f.createVariable('Data', Particle_t, 'NRecords')
data = numpy.empty(size, Particle)
```

```
# 16-character String
# Unsigned short integer
# 32-bit integer
# 32-bit integer
# float (single-precision)
# double (double-precision)
# Signed 64-bit integer
# array of floats (single-precision)
```

Create compound with Python

```
for i in xrange(10):
    data['name'][i] = stringtoarr('Particle: %6d' % (i),16)
    data['ADCcount'][i] = (i * 256) % (1 << 16)
    data['grid_i'][i] = i
    data['grid_j'][i] = 10 - i
    data['pressure'][i] = float(i*i)
    data['energy'][i] = float(data['pressure'][i] ** 4)
    data['idnumber'][i] = i * (2 ** 34)
    data['pressure2'][i] = [
        [0.5+float(i),1.5+float(i),2.5+float(i)],
        [-1.5+float(i),-2.5+float(i),-3.5+float(i)]]
#Fill data in File
v[:] = data

f.close()
```

Code works on gpc with the modules :

```
module load gcc/4.8.1 hdf5/187-v18-serial-gcc netcdf/4.1.3-hdf5_serial-gcc intel/14.0.0 python/2.7.2
```

Create compound with Python :

ncdump particles.nc :

```
netcdf particles {
types:
  compound Particle {
    char name(16) ;
    ushort ADCcount ;
    int grid_i ;
    int grid_j ;
    float pressure ;
    double energy ;
    int64 idnumber ;
    float pressure2(2, 3) ;
  }; // Particle
dimensions:
NRecords = UNLIMITED ; // (10 currently)
variables:
Particle Data(NRecords) ;
data:

Data =
{"Particle:uuuuuu0"}, 0, 0, 10, 0, 0, 0, {0.5, 1.5, 2.5, -1.5, -2.5, -3.5}},
{"Particle:uuuuuu1"}, 256, 1, 9, 1, 1, 17179869184, {1.5, 2.5, 3.5, -0.5, -1.5, -2.5}},
{"Particle:uuuuuu2"}, 512, 2, 8, 4, 256, 34359738368, {2.5, 3.5, 4.5, 0.5, -0.5, -1.5}},
{"Particle:uuuuuu3"}, 768, 3, 7, 9, 6561, 51539607552, {3.5, 4.5, 5.5, 1.5, 0.5, -0.5}},
{"Particle:uuuuuu4"}, 1024, 4, 6, 16, 65536, 68719476736, {4.5, 5.5, 6.5, 2.5, 1.5, 0.5}},
{"Particle:uuuuuu5"}, 1280, 5, 5, 25, 390625, 85899345920, {5.5, 6.5, 7.5, 3.5, 2.5, 1.5}},
{"Particle:uuuuuu6"}, 1536, 6, 4, 36, 1679616, 103079215104, {6.5, 7.5, 8.5, 4.5, 3.5, 2.5}},
{"Particle:uuuuuu7"}, 1792, 7, 3, 49, 5764801, 120259084288, {7.5, 8.5, 9.5, 5.5, 4.5, 3.5}},
{"Particle:uuuuuu8"}, 2048, 8, 2, 64, 16777216, 137438953472, {8.5, 9.5, 10.5, 6.5, 5.5, 4.5}},
{"Particle:uuuuuu9"}, 2304, 9, 1, 81, 43046721, 154618822656, {9.5, 10.5, 11.5, 7.5, 6.5, 5.5}} ;
}
```

Read compound with Python :

```
from netCDF4 import Dataset
from netCDF4 import chartostring, stringtoarr
import numpy

f = Dataset('particles.nc', 'r', format='NETCDF4')
v = f.variables['Data']
datain = v[:] # read in all the data into a numpy structured array

Particle = numpy.dtype([( 'name', 'S1', 16), # 16-character String
                        ( 'ADCcount', numpy.uint16 ), # Unsigned short integer
                        ( 'grid_i', numpy.int32 ), # 32-bit integer
                        ( 'grid_j', numpy.int32 ), # 32-bit integer
                        ( 'pressure', numpy.float32 ), # float (single-precision)
                        ( 'energy', numpy.float64 ), # double (double-precision)
                        ( 'idnumber', numpy.int64 ), # Signed 64-bit integer
                        ( 'pressure2', numpy.float32, (2,3) ) # array of floats (single-precision)
                        ])
```

Read compound with Python :

```
Mydata = numpy.empty( datain.shape , Particle )
```

```
Mydata['name'] = datain['name'];  
Mydata['ADCcount'] = datain['ADCcount'];  
Mydata['grid_i'] = datain['grid_i'];  
Mydata['grid_j'] = datain['grid_j'];  
Mydata['pressure'] = datain['pressure'];  
Mydata['energy'] = datain['energy'];  
Mydata['idnumber'] = datain['idnumber'];  
Mydata['pressure2'] = datain['pressure2'];
```

```
for i in xrange(int(str((datain.shape))[1:-2])):  
    print "\"" + str(charstring(Mydata['name'][i])) + "\", " + str(Mydata['ADCcount'][i]) + ", "  
    + str(Mydata['grid_i'][i]) + ", " + str(Mydata['grid_j'][i]) + ", " + str(Mydata['pressure'][i]) + ", "  
    + str(Mydata['energy'][i]) + ", " + str(Mydata['idnumber'][i])  
    print str(Mydata['pressure2'][i])
```

```
f.close()
```

gives this output :

```
" Particle:      0", 0, 0, 10, 0.0, 0.0, 0  
[[ 0.5  1.5  2.5]  
 [-1.5 -2.5 -3.5]]  
" Particle:      1", 256, 1, 9, 1.0, 1.0, 17179869184  
[[ 1.5  2.5  3.5]  
 [-0.5 -1.5 -2.5]]  
...
```

Create compound with C++ (1)

```
#include <iostream>
#include <netcdfcpp.h>
#include <stdlib.h>
#include <stdio.h>
#include <string.h>
#include <math.h>
using namespace std;

#define FILE_NAME "particles.nc"
#define SVC_REC "Particle"
#define DIM_LEN 10 //number of records in file
int main(void)
{
    typedef struct Particle
    {
        char    name[16];
        unsigned short int    ADCcount;
        int    grid_i;
        int    grid_j;
        float    pressure;
        double    energy ;
        long    idnumber;
        float    pressure2 [2][3];
    } Particle;

    //Definition of the data_in variable
    Particle data_in[DIM_LEN];
```

Create compound with C++ (2)

```
//Filling variable
for (int i=0; i<DIM.LEN; i++){
    char outString [ sizeof (data_in [ i ].name)];
    sprintf(outString, "%s%d", " Particle: ", i);
    memcpy(data_in [ i ].name, outString, sizeof (data_in [ i ].name));;
    data_in [ i ].ADCcount=(i * 256) % 65536;
    data_in [ i ].grid_i=i;
    data_in [ i ].grid_j=10-i;
    data_in [ i ].pressure=float (i*i);
    data_in [ i ].energy=float (pow (data_in [ i ].pressure ,4));
    data_in [ i ].idnumber=i * (pow (2,34));
    for (int k=0; k<3; k++){
        data_in [ i ].pressure2 [0][k]=0.5+k+float (i);
        data_in [ i ].pressure2 [1][k]=-1.5-k+float (i);
    }
}
```

//Variables needed to create the NetCDF file :

```
int ncid , varid , mtypeid;
int dimid;
int dimids[] = {0}, fieldid;
char name[NC_MAX_NAME + 1];
size_t size;
size_t nfields;
```

Create compound with C++ (3)

```
//create the NetCDF file :
nc_create(FILE_NAME,NC.NETCDF4,&ncid);
nc_def_compound(ncid, sizeof(Particle), SVC_REC, &mtypeid);
nc_inq_compound(ncid, mtypeid, name, &size, &nfields);
nc_insert_compound(ncid, mtypeid, "ADCcount",
                  NC_COMPOUND_OFFSET(Particle, ADCcount), NC_SHORT);
nc_insert_compound(ncid, mtypeid, "grid_i",
                  NC_COMPOUND_OFFSET(Particle, grid_i), NC_INT);
nc_insert_compound(ncid, mtypeid, "grid_j",
                  NC_COMPOUND_OFFSET(Particle, grid_j), NC_INT);
nc_insert_compound(ncid, mtypeid, "pressure",
                  NC_COMPOUND_OFFSET(Particle, pressure), NC_FLOAT);
nc_insert_compound(ncid, mtypeid, "energy",
                  NC_COMPOUND_OFFSET(Particle, energy), NC_DOUBLE);
nc_insert_compound(ncid, mtypeid, "idnumber",
                  NC_COMPOUND_OFFSET(Particle, idnumber), NC_INT64);
int dim_sizes [] = {2,3};
nc_insert_array_compound(ncid, mtypeid, "pressure2",
                        NC_COMPOUND_OFFSET(Particle, pressure2), NC_FLOAT,2,dim_sizes);
int dim_sizes2 [] = {16};
nc_insert_array_compound(ncid, mtypeid, "name",
                        NC_COMPOUND_OFFSET(Particle, name), NC_CHAR,1,dim_sizes2);
```

Create compound with C++ (4)

```
nc_def_dim(ncid, "NRecords", DIM_LEN, &dimid);
nc_def_var(ncid, "Data", mtypeid, 1, dimids, &varid);
nc_put_var(ncid, varid, data_in);
nc_close(ncid);

cout << "*** SUCCESS writing example file "<<FILE_NAME<<!" << endl;
return 0;
}
```

```
module load gcc/4.8.1 hdf5/1.8.12-serial-gcc netcdf/4.1.3_hdf5_serial-gcc
gcc -I$SCINET_NETCDF_INC Test.cpp -o Test -lnetcdf_c++
./Test
```

```
*** SUCCESS writing example file particles.nc!
```

```
ls -ltrh particles.nc
-rw-r--r-- 1 brelier scinet 6.2K Feb 20 12:02 particles.nc
```

Reading compound with C++

```
#include <iostream>

```

NetCDF and R

RNetCDF: R Interface to NetCDF Datasets

provides an interface to Unidata's NetCDF library functions (version 3)

<http://cran.r-project.org/web/packages/RNetCDF/index.html>

Presently developing an interface to NetCDF version 4

```
module load intel/14.0.1 R/3.0.1 gcc/4.8.1 hdf5/1811-v18-serial-gcc netcdf/4.2.1.1_serial-gcc udunits/2.1.11
```

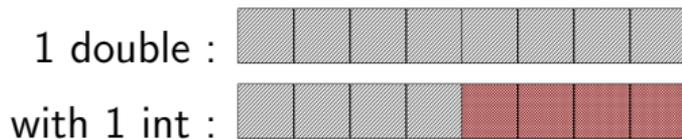

```
R CMD INSTALL --configure-args="--with-netcdf-include='$SCINET_NETCDF_INC' --with-netcdf-lib='$SCINET_NETCDF_LIB' --with-udunits-include='$SCINET_UDUNITS_INC' --with-udunits-lib='$SCINET_UDUNITS_LIB' " RNetCDF_2.0.tar.gz
```

Add-on-packages can be written in C.

Issues with interface in C

- As we saw in the C++ examples, struct used to define the compound variable.
- Issue arrived when I tried to generalize the interface to a generic compound type :
- For a specific compound size, I did not want to code every possible combination of variables :
 - ▶ example with size = 8 bytes : 1 double, 2 floats, 2 int, 1float + 1int, 8 characters ...
- solution : use union in C
- unions allow to share same memory for several variables.

```
struct s1
{
    union{
        int i[2];
        float f[2];
        double d[1];
        short myShort[4];
        unsigned short myUnsignedShort[4];
        unsigned int myUnsignedInt[2];
        long mylong[1];
        unsigned long myUnsignedLong[1];
        char mybyte[8];
    }u;
};
struct s1 data;
data.u.d[0]=5.;
```

```
s1 Data;
Data.u.d[0]=5.;
std::cout<<Data.u.d[0]<<std::endl;
Data.u.i[1]=5;
std::cout<<Data.u.d[0]<<std::endl;
```

prints :

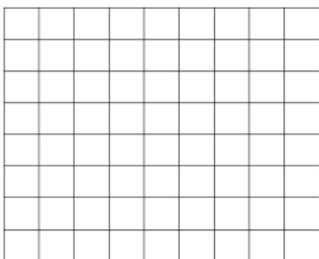

```
5
1.061e-313
```

Issues with interface in C

- Problem with struct : need to create one struct per struct size to have a generic interface.
- Other solution : allocate memory for the data and fill the compound variable by byte.

```
int DIM_LEN = INTEGER(Nrecords)[0];
```

```
char **data = (char **)malloc(sizeof(char*)*DIM_LEN);  
data[0] = (char **)malloc(sizeof(char)*DIM_LEN * INTEGER(size)[0] );  
for(int i=0;i<DIM_LEN;i++) {  
    data[i]=&data[0][i*INTEGER(size)[0]];  
}
```

```
nc_put_var(mycid, myvarid, &data[0][0]);
```

```
free(data[0]);  
free(data);
```

Create compound with R

```
Data <- data.frame(name=I(list()) , ADCcount=I(list()) , grid_i=I(list()) , grid_j=I(list()) ,pressure=I(list())
,energy=I(list()) ,idnumber=I(list()) , pressure2=I(list()) )
n<-10
for(i in 1:n){
Data[[i,'name']] =paste("Particle :      ", (i-1), sep = "")
Data[[i,'ADCcount']] =i*256
Data[[i,'grid_i']] =i+0
Data[[i,'grid_j']] =10-i
Data[[i,'pressure']] =i*i*1.
Data[[i,'energy']] =(i*i)^4
Data[[i,'idnumber']] =i*(2)^34
Data[[i,'pressure2']] =c(0.5+i,1.5+i,2.5+i,i-1.5,i-2.5,i-3.5)
}

library(RNetCDF)
nc <- create.nc("particles.nc","NC_NETCDF4")
mycompound <- compound.def.nc(nc,70,"Particle")
compound.inq.nc(nc,mycompound)
mycompound <- compound.insert.nc(nc,mycompound,"name","NC_CHAR",16)
mycompound <- compound.insert.nc(nc,mycompound,"ADCcount","NC_USHORT")
mycompound <- compound.insert.nc(nc,mycompound,"grid_i","NC_INT")
mycompound <- compound.insert.nc(nc,mycompound,"grid_j","NC_INT")
mycompound <- compound.insert.nc(nc,mycompound,"pressure","NC_FLOAT")
mycompound <- compound.insert.nc(nc,mycompound,"energy","NC_DOUBLE")
mycompound <- compound.insert.nc(nc,mycompound,"idnumber","NC_INT64")
mycompound <- compound.insert.nc(nc,mycompound,"pressure2","NC_FLOAT",2,3)

dim.def.nc(nc,"NRecords",10)
myvar <- var.def.nc(nc,mycompound,"Data",1)
compound.fill.nc(nc,mycompound,myvar,Data)
close.nc(nc)
```

Read compound in R

```
> library(RNetCDF)
> df <- get.compound.nc("particles.nc", "NRecords", "Data")
> df
```

		name	ADCcount	grid_i	grid_j	pressure	energy	idnumber
1	Particle :	0	256	1	9	1	1	16
2	Particle :	1	512	2	8	4	256	32
3	Particle :	2	768	3	7	9	6561	48
4	Particle :	3	1024	4	6	16	65536	64
5	Particle :	4	1280	5	5	25	390625	80
6	Particle :	5	1536	6	4	36	1679616	96
7	Particle :	6	1792	7	3	49	5764801	112
8	Particle :	7	2048	8	2	64	16777216	128
9	Particle :	8	2304	9	1	81	43046721	144
10	Particle :	9	2560	10	0	100	100000000	160

Package is experimental : multidimension variables not working to read from NetCDF
: issue is not reading the multivariable from NetCDF but to create a multidimension variable in the dataframe in the C interface.

Conclusion

- Presented a few examples to read and write a compound variable in NetCDF
http://wiki.scinethpc.ca/wiki/index.php/NetCDF_table
- Many different types supported in NetCDF : int, float, double, enum ...
- NetCDF for I/O :
<http://wiki.scinethpc.ca/wiki/images/a/af/Netcdfhdf5.pdf>
- Parallel netCDF: A Parallel I/O Library for NetCDF File Access.
Compound variables (actually HDF5) isn't compatible with parallel-netcdf.
- parallel I/O facilities in NetCDF-4 : `nc_open_par()`
