

# Job Monitoring on SciNet and Job Efficiency

Ramses van Zon

SciNet, Toronto

## SciNet systems are batch compute clusters

- Computing by submitting **batch jobs** to the **scheduler**.
- When you submit a job, it gets placed in a **queue**.
- Job priority is based on **allocation** and **fairshare**.
- When sufficient nodes are free to execute a job, it starts the job on the appropriate compute nodes.
- Jobs remain **'idle'** until resources become available.
- Jobs can be temporarily **'blocked'** if you submit too much.

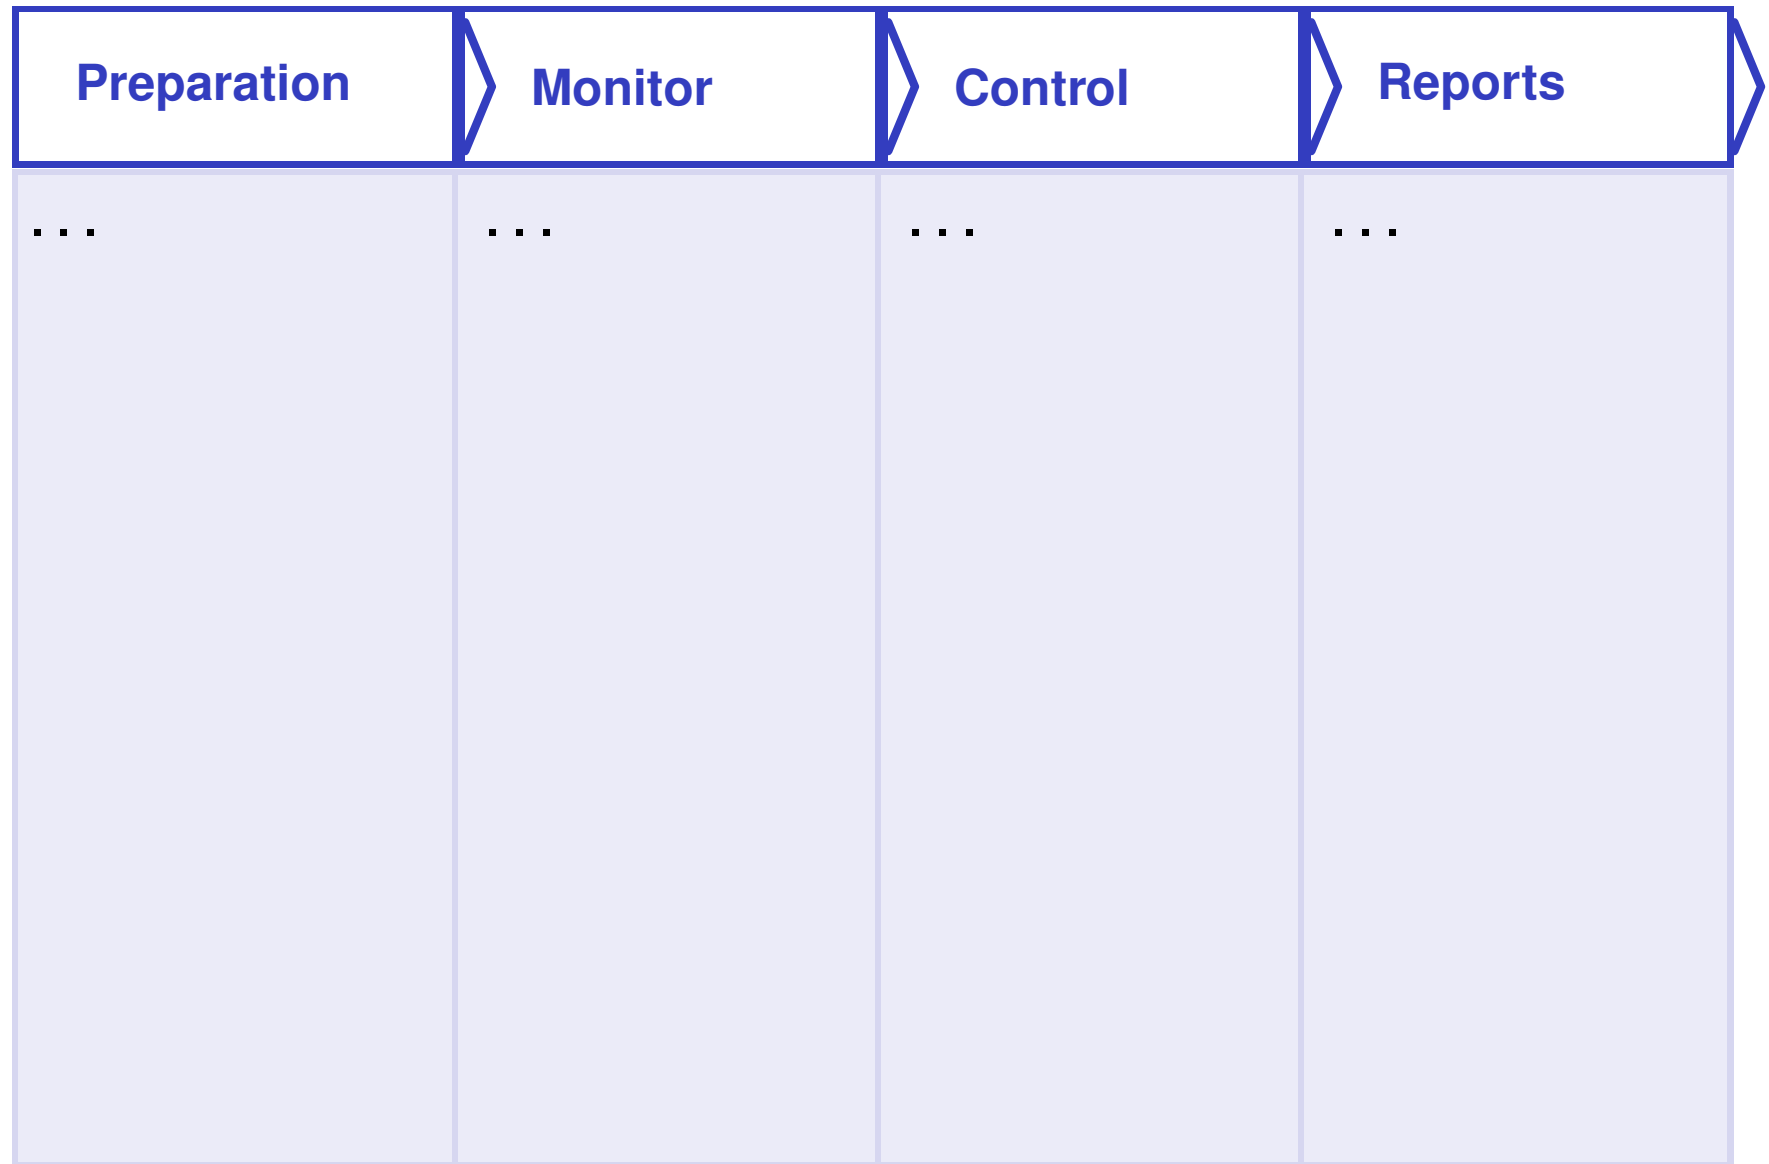

## Components

**Torque:** Resource manager providing control over batch jobs and distributed compute nodes.

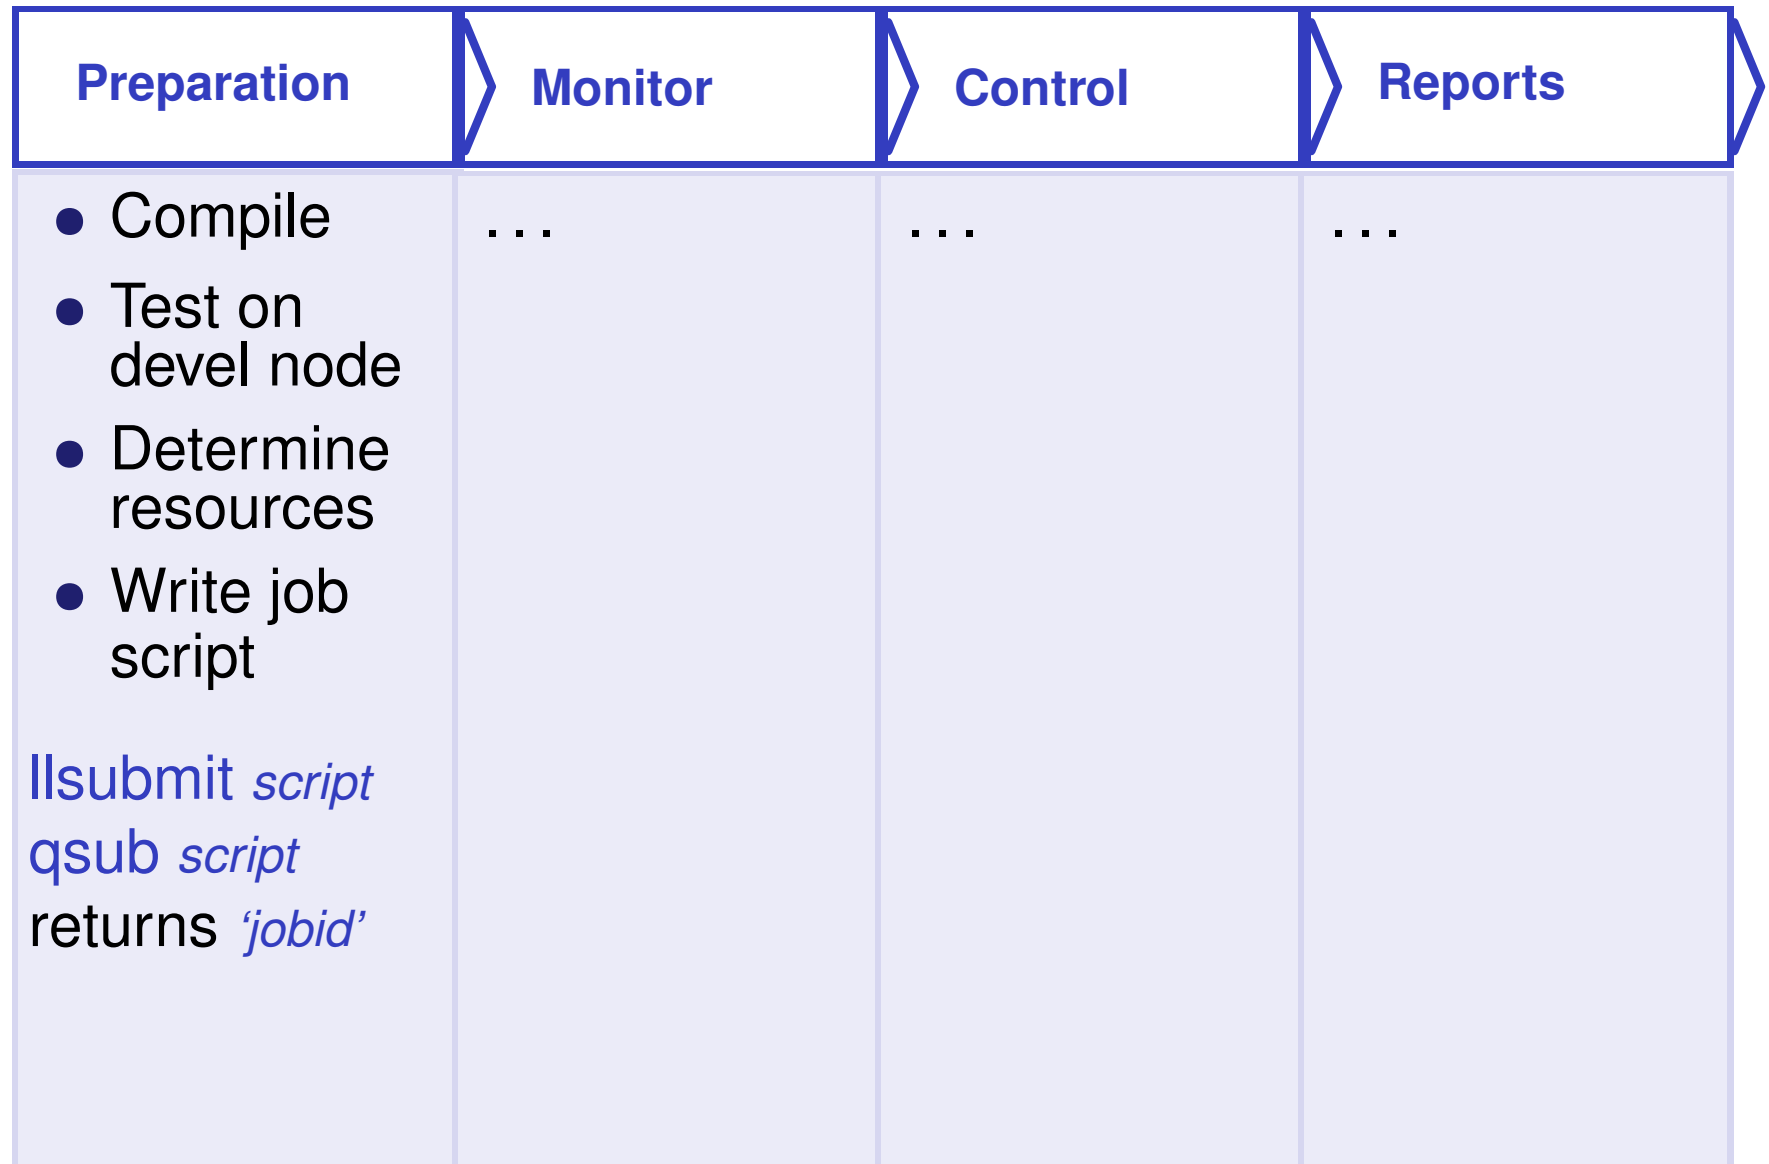

**Moab:** A policy-based job scheduler and event engine that enables utility-based computing for clusters.

**Fairshare:** Mechanism using past utilization for prioritization.

## qstat and checkjob

- Show torque status right away on GPC: `qstat`
- Show moab status (better): `checkjob jobid`
- See more details of the job: `checkjob -v jobid`  
(e.g., why is my job blocked?)

## qstat and checkjob

- Show torque status right away on GPC: `qstat`
- Show moab status (better): `checkjob jobid`
- See more details of the job: `checkjob -v jobid`  
(e.g., why is my job blocked?)

## showq

- See all the jobs in the queue: `showq` (from gpc or tcs)
- See your jobs in the queue: `showq -u user`

## qstat and checkjob

- Show torque status right away on GPC: `qstat`
- Show moab status (better): `checkjob jobid`
- See more details of the job: `checkjob -v jobid`  
(e.g., why is my job blocked?)

## showq

- See all the jobs in the queue: `showq` (from gpc or tcs)
- See your jobs in the queue: `showq -u user`

## showstart and showbf

- Estimate when a job may start: `showbf [-f ib]`
- Estimate when a queued job may start: `showstart jobid`

checkjob

- checkjob *jobid*

## checkjob

- `checkjob jobid`

## output/error files

- `/home/user/.pbs_spool/jobid.OU`
- `/home/user/.pbs_spool/jobid.ER`

## checkjob

- `checkjob jobid`

## output/error files

- `/home/user/.pbs_spool/jobid.OU`
- `/home/user/.pbs_spool/jobid.ER`

## showq

- `showq -r -u user`

## checkjob

- `checkjob jobid`

## output/error files

- `/home/user/.pbs_spool/jobid.OU`
- `/home/user/.pbs_spool/jobid.ER`

## showq

- `showq -r -u user`

## ssh

- `ssh node` (node name from checkjob)
- `top`: shows process state, memory and cpu usage

# Top example

```

canceljob

- If you spot a mistake: `canceljob jobid`

## canceljob

- If you spot a mistake: `canceljob jobid`

## qsub for interactive and debug jobs

- `-I`:
  - Interactive
  - After `qsub`, waits for jobs to start.
  - Usually combined with:
- `-q debug`:
  - Debug queue has 10 nodes reserved for short jobs.
  - You can get 1 node for 2 hours, but also
  - 8 nodes, for half an hour.

## output/error files

- \*.e / \*.o  
In submission directory by default, unless set in *script*.

## output/error files

- \*.e / \*.o  
In submission directory by default, unless set in *script*.

## Statistics

- Short term: `showstats -u USER`
- Year-to-date: [SciNet Portal](#)  
Usage stats for past year, showing a breakdown of TCS, GPC\_eth, and GPC\_ib usage. Updated every 24 hours.

## Note

Most of these work on TCS as well.

Additional tools may become available.
